<ul style="list-style-type: none"> ● In a 2004 manuscript, John MacFarlane [9] investigates various <i>bridge principles</i> linking logic and epistemology. ● Specifically, he investigates principles of the general form: (BP) If $\Gamma \models p$ (i.e., if the argument from Γ to p is <i>valid</i>), then (normative claim about believing (members of) Γ and/or p). ● MacFarlane’s idea was to (a) try to articulate plausible instances of (BP), and then (b) <i>use</i> these (BP)’s to get traction on various (vexed) debates about the nature of validity. ● If this could be made to work, then (or so one of the central hopes was) perhaps it could generate reasons for logicians (of some stripes) to <i>revise</i> their logical principles. ● Today, I will try to articulate a dilemma for the application of MacFarlane-style (BP)’s in the service of trying to provide <i>classical</i> logicians with reasons to revise their logical beliefs. ● I will also explain why Goodman’s [6] argument against (Carnapian) <i>inductive</i> logic faces a similar dilemma.

<ul style="list-style-type: none"> ● I will, for the sake of today’s arguments, grant that logic is “normative for thought” in at least the following sense: (NL) If S believes that p and (then) S becomes convinced that there is a <i>sound</i> argument <i>against</i> p, then this puts pressure on S to revise their belief that p. ● I will take (NL) as common ground between the classical and non-classical logician. Moreover, I will assume that (NL) can be applied to both logical and non-logical p’s. ● The disagreement about deductive logic (Vignette #1) I’ll discuss today will have to do with the nature of <i>validity</i>. ● I will be talking about an agent (Gil) who accepts (NL), and who understands “validity” as “necessary truth preservation” (viz., classical deductive validity/entailment). ● Our non-classical (specifically, relevant/para-consistent) logician (Bob) will be trying to convince Gil that there a sound argument against “explosion” (the classical rule).

<ul style="list-style-type: none"> ● In the second Vignette, I will discuss an analogous dialectic that arises between a classical inductive logician (Rudolf) and a non-classical inductive logician (Nelson). ● Nelson’s goal is like Bob’s. He will try to convince Rudolf that there is a sound argument against a fundamental tenet of Rudolf’s favorite variety of classical inductive logic. ● In both cases, the non-classical logician aims to produce an argument that: (a) the classical logician should accept as sound, and (b) refutes a (central) classical logical principle. ● While the arguments I initially present will seem like straw men, I will argue/suggest/conjecture that there is no way to fix them so that they will satisfy both desiderata (a) and (b). ● Specifically, my conjecture/challenge will be that any argument (along the general epistemological lines pursued by Bob and Nelson) will involve a <i>bridge principle</i> linking logic & epistemology that is either <i>implausible</i> or <i>too weak</i>.

-------------------	--------------------------------------	--------------------------------------	------------

- Let $Gx \stackrel{\text{def}}{=} x$ is green, $Ox \stackrel{\text{def}}{=} x$ is observed (for the first time) prior to t , and $Ex \stackrel{\text{def}}{=} x$ is an emerald. And, define “grue” as:

$$Gx \stackrel{\text{def}}{=} x \text{ is grue} \stackrel{\text{def}}{=} Ox \equiv Gx.$$
- Consider the following two universal generalizations
 (H_1) All emeralds are green. $[(\forall x)(Ex \supset Gx)]$
 (H_2) All emeralds are grue. $[(\forall x)[Ex \supset (Ox \equiv Gx)]]$
- And, consider the following instantial evidential proposition
 $(E) Ea \ \& \ Oa \ \& \ Ga$
- Now, suppose S is in a “grue context” C_G such that S already knows that Oa (since t is far in the future).
- Finally, consider the following “bridge principle” linking logic (confirmation) and epistemology (evidential support):
 $(\text{RTE}) E$ evidentially supports H for S in C iff E confirms H , relative to K , where K is S 's total evidence in C .
- Now we're ready to examine Nelson's *reductio* of (\star) .

Background ○○○	Vignette #1: Deductive Logic ○○○○	Vignette #2: Inductive Logic ○○●○	References
-------------------	--------------------------------------	--------------------------------------	------------

- Nelson offers Rudolf the following *classical reductio* of (\star) .
 1. E confirms H , relative to K iff $\text{Pr}(H \mid E \ \& \ K) > \text{Pr}(H \mid K)$.
 - This is (\star) , and it is being supposed for *reductio*.
 2. E evidentially supports H for S in C iff E confirms H , relative to K , where K is S 's total evidence in C .
 - This is the B.P. [(RTE)] linking logic and epistemology.
 3. The agent S who is assessing the evidential support E provides for H_1 vs H_2 in C_G already knows that Oa , and so Oa is part of S 's total evidence in C_G [i.e., $K \models Oa$].
 - This is part of the set-up of the “grue” context C_G [2].
 4. If $K \models Oa$, then—*c.p.*— E confirms H_1 relative to K iff E confirms H_2 relative to K , for **any** function $\text{Pr}(\cdot \mid \cdot)$.
 5. Therefore, E evidentially supports H_1 for S in C_G if and only if E evidentially supports H_2 for S in C_G .
 6. E evidentially supports H_1 for S in C_G , but E does *not* evidentially support H_2 for S in C_G .
- Contradiction. And, *reductio* of (\star) complete. Or is it ...

- (6) is Nelson's intuition about the evidential relations in C_G . One could question this, but I'll suppose Rudolf accepts it.
- (5) follows from (1)–(4). So, we can proceed to (4).
- (4) is (*ceteris paribus*) a theorem of probability calculus.
 - The *c.p.* clause needed is $\text{Pr}(Ea \mid H_1 \ \& \ K) = \text{Pr}(Ea \mid H_2 \ \& \ K)$, which is typically assumed (and Rudolf accepts it for C_G).
- (3) is a kosher stipulation in Nelson's setup (*pace* [2]).
- (2) is the bridge principle linking inductive logic (confirmation) and epistemology (evidential support).
- Rudolf will/should see this as a *sound reductio* of (\star) just in case he will/should believe that (2) is true.
- But, Rudolf should *not* believe that (2) is true.
 - There are *independent reasons to reject* (2). Most notably, Glymour's *old evidence problem* [5].
- Conjecture: (\ddagger) any B.P. will be implausible *and/or* too weak.
